

You will be working on Product Detail Page (PDP), you will need to improve code in a way that it is not just “working” but following “best practices”.

You can find initial code here: <https://repl.it/@MauricioBedoya/ProductPage>

You can re-use code we have been working on last sessions:

https://bitbucket.org/ast_mbedoya/mvc/src/master/ (feature/eventmgr branch)

These are your tasks:

1. Refactor code base: it should be written using MVC approach. You can create Pdp Module (PdpController, PdpModel and PdpView).
2. Track user actions: Every action the user performs (page load, click on images, buttons and tabs) should be added to notification section (<http://prntscr.com/ntpfzu>). You should update this section every second. Notification module should be independent from Pdp, meaning that Pdp should not listen to Notification events and vice versa (<http://prntscr.com/ntph23>).
3. You should bundle all your scripts in a way that only 1 script is added to the html.
4. You should have src and dist folders (dist will contain minified version of files: version of css, images, scripts, etc for Production)
